Subject: Re: Matthew's MRI

Dear Mr. and Mrs. Wulf:

I am very glad to hear about Matthew's MRI result. It sound very encouraging.

Liver enzymes such as AST and ALT are elevated if there is liver cell breakdown (liver toxicity). The ammonia can rise from liver toxicity as well. In the case of peroxisomal disorders liver toxicity is expected. Treatment of a peroxisomal disorder should help to relieve toxicity. Since Matthew is doing well in other areas, I expect that his treatment is working to relieve liver toxicity, and keep his liver as healthy as possible.

I hope that my interpretation is helpful. I am sure that Dr. Martinez will comment on these issues, and I look forward to her report.

Best wishes,

Dwight Koeberl
