To Whom it may concern,

My 9 year old son, Maximus, has been taking the supplement DHA-ethyl ester since he was 15 months old. Before Maximus started the treatment, he was blind, his liver enzymes were very highly elevated and he was not eating or sleeping well at night. At 15 months old, we took Max to Spain to begin the DHA-EE treatment with Dr. Manuela Martinez. After a couple weeks on the treatment, we noticed huge differences. Maximus started eating baby food, sleeping at night and his eyes began focusing on our faces. We have had times when Maximus was without the treatment because of shipping issues. After about only 45 days, Maximus will stop eating and starts waking up many times during the night. Over all, this treatment has stabilized Maximus health and has given him a much better quality of life.

Sincerely,

Tara Cornell mother of Maximus Manciu
